

preval.macro

- コンパイル時に事前実行を提供する
- どうせ値になるのでフロントエンドで**fs**を使うとか、まあ何でもあり😱

Before:

```
const greeting = preval`
  const fs = require('fs')
  module.exports = fs.readFileSync(require.resolve('./greeting.txt'), 'utf8')
`
```

After (assuming `greeting.txt` contains the text: `"Hello world!"`):

```
const greeting = 'Hello world!'
```

import-all-macro

glob形式で
dynamic
import

```
import importAll from 'import-all-macro'

document.getElementById('load-stuff').addEventListener('click', () => {
  importAll('./files/*.js').then(all => {
    console.log(all)
  })
})
```

↓ ↓ ↓ ↓ ↓ ↓

```
document.getElementById('load-stuff').addEventListener('click', () => {
  Promise.all([
    import('./files/a.js'),
    import('./files/b.js'),
    import('./files/c.js'),
    import('./files/d.js'),
  ])
  .then(function importAllHandler(importVals) {
    return {
      './files/a.js': importVals[0],
      './files/b.js': importVals[1],
      './files/c.js': importVals[2],
      './files/d.js': importVals[3],
    }
  })
  .then(all => {
    console.log(all)
  })
})
```
