```jsx
import * as React from 'react'

class App extends React.Component {
  onClick = () => {
    console.log('remove onClick & save')
  }
  render() {
    return <div>Hello SFC :)</div>
  }
}

export default App
```

```
import * as React from 'react'

class App extends React.Component {
  onClick = () => {
    console.log('remove onClick & save')
  }

  render() {
    return <div>Hello SFC :)</div>
  }
}

export default App
```

```
import * as React from 'react'

class App extends React.Component {
  onClick = () => {
    console.log('remove onClick & save')
  }

  render() {
    return <div>Hello SFC :)</div>
  }
}

export default App
```

How?

- react-optimizeで登場したbabel-plugin-transform-react-pure-class-to-functionをs2s.config.jsに指定(ええ、全てのbabelの資産を使えます💯)

```
module.exports = {
  plugins: [
    {
      test: /.*.js$/, // 対象とするファイル
      plugin: ['transform-react-pure-class-to-function'], // 指定するプラグイン
    },
  ],
}
```
